

Patch My PC: Patch Management Project

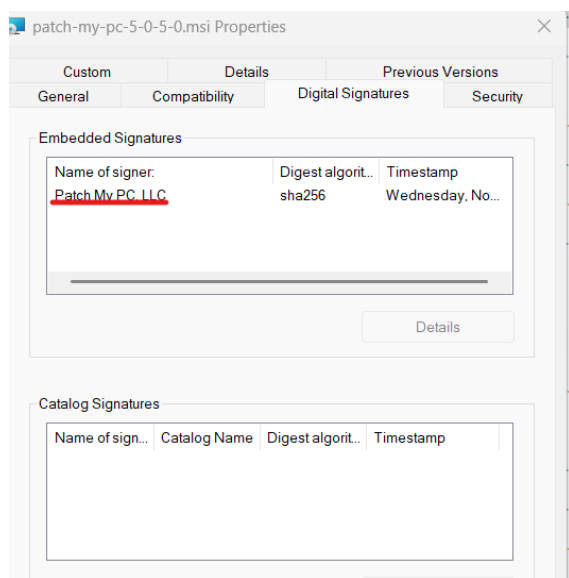

Patch management plays an important role in cybersecurity practice, highly reducing security vulnerabilities.

In this project, I focused my attention on the tool **Patch My PC** to automate and manage software updates on a Windows machine.

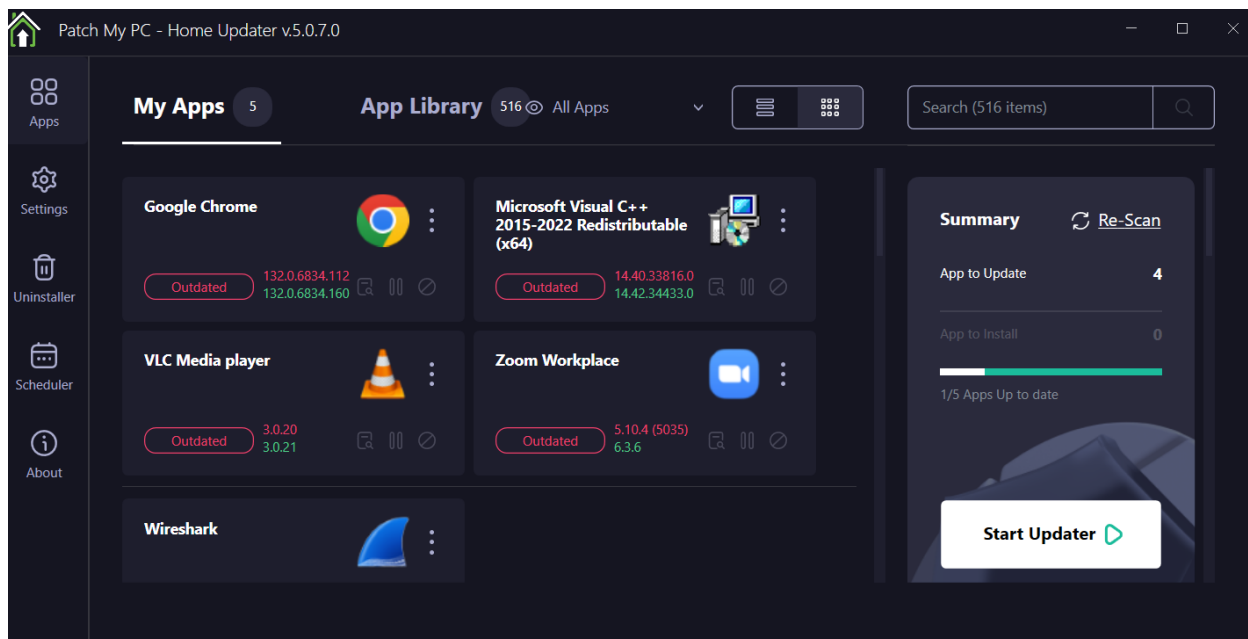

This report documents the process, findings, and key takeaways.

1) Installation and setup

The app was downloaded from the official site, <https://patch-my-pc.en.uptodown.com/windows>

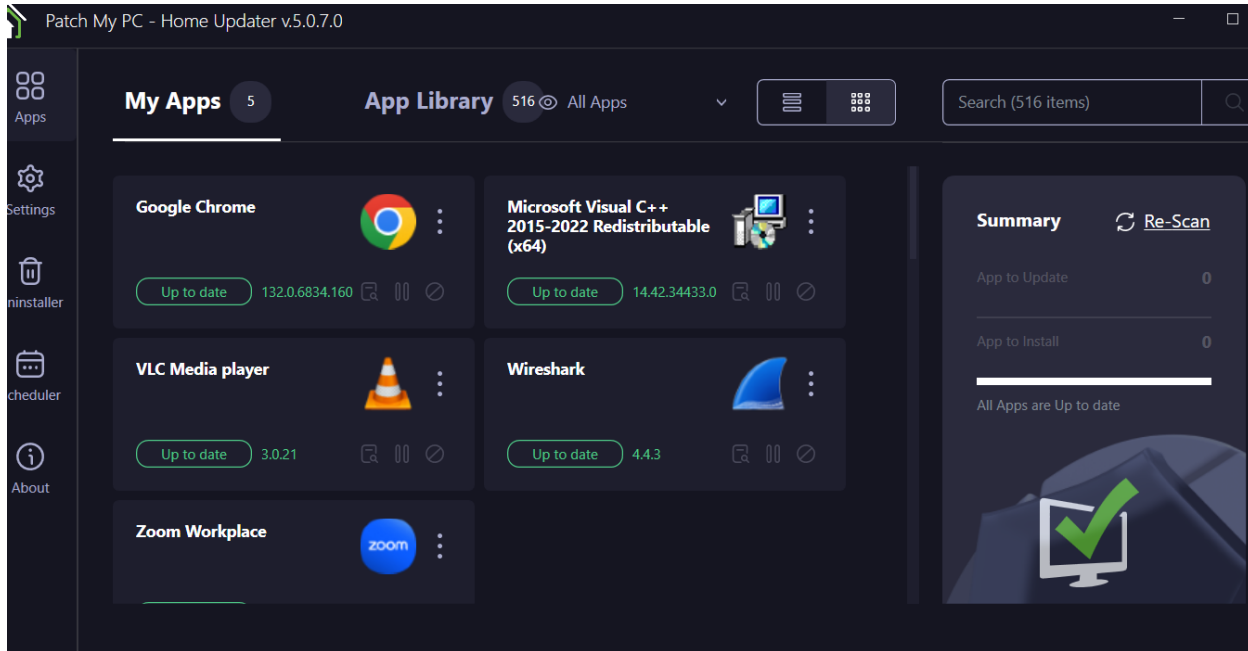

2) Issues detected – several apps were outdated

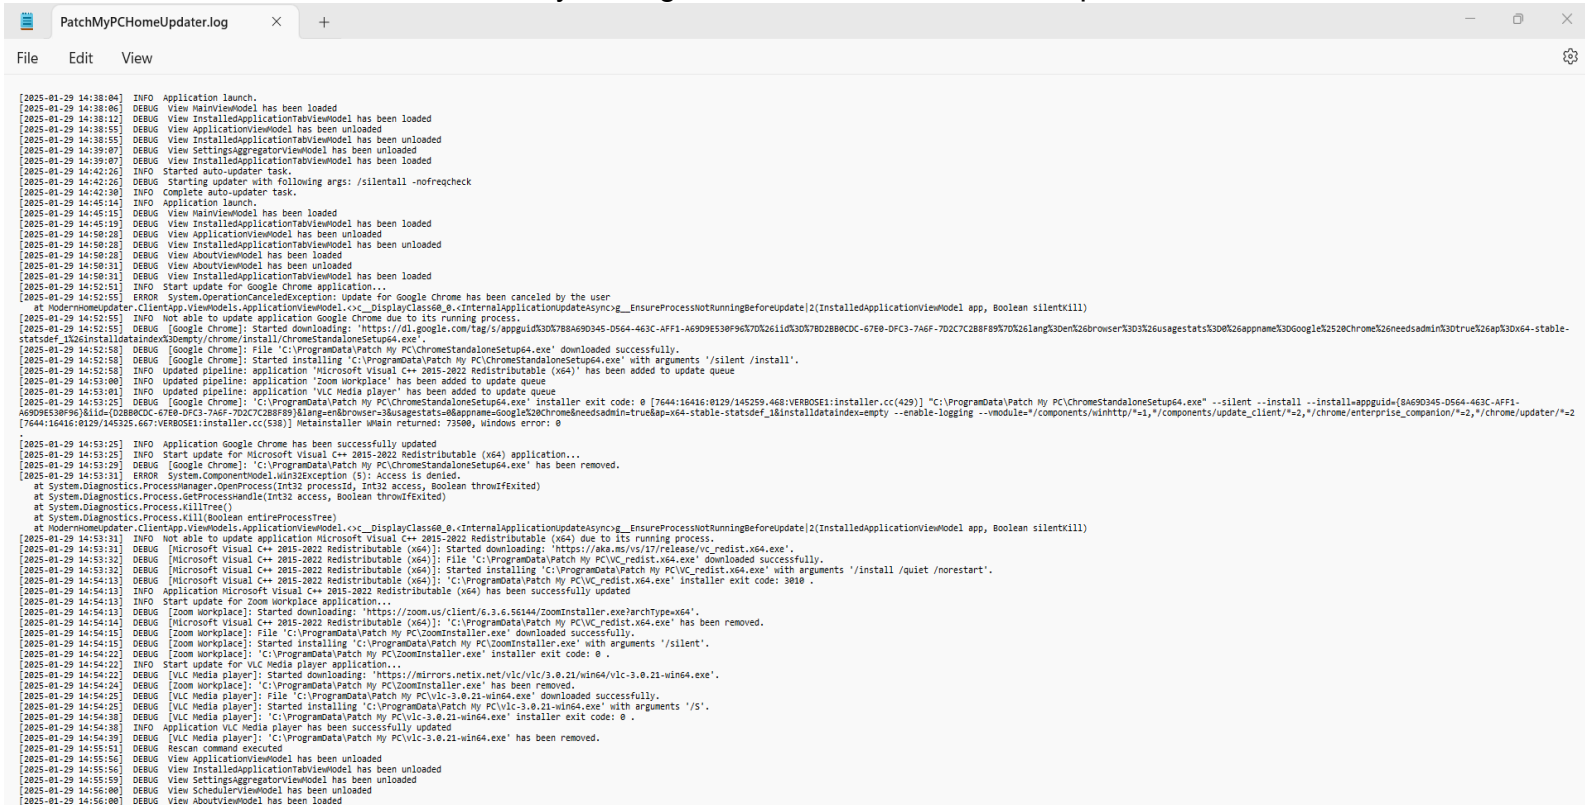

3) Steps taken

- I've selected the outdated applications for update.
- I've initiated the update process and monitored their progress.
- I've verified that the software was successfully updated.

4) Next step: analyzing the logs

-I've accessed the Patch My PC logs to confirm the successful updates.

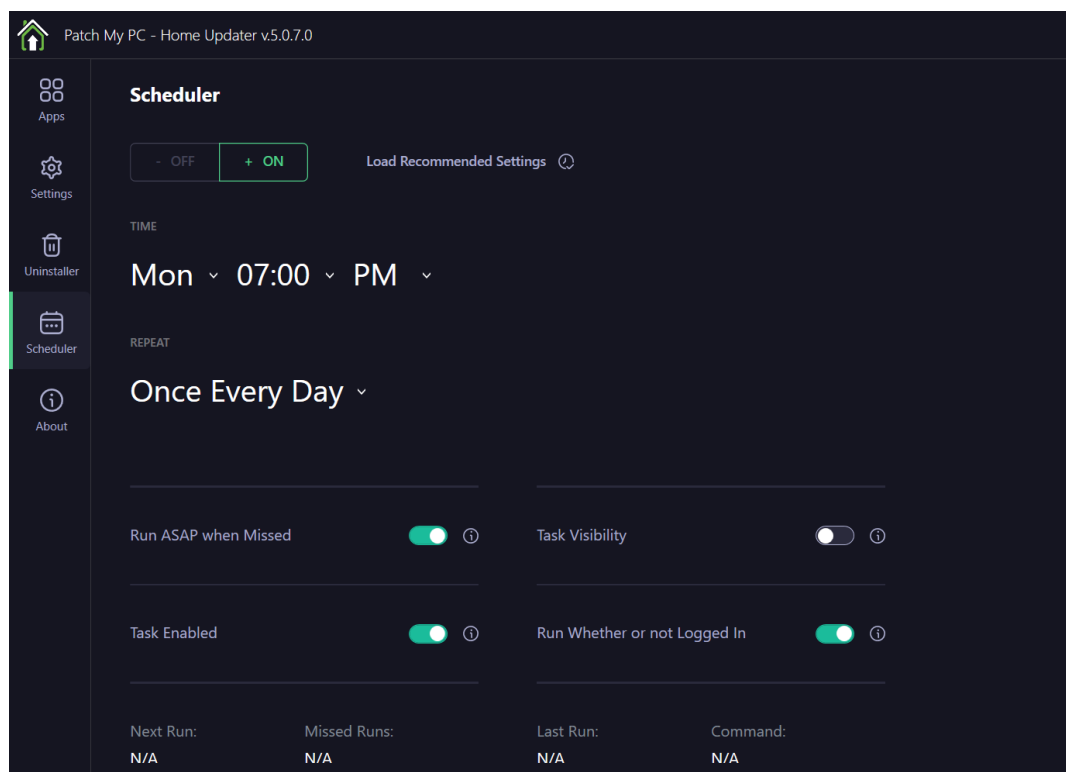

I've analyzed the logs and could observe the following:

- Apps like Google Chrome, Microsoft Visual C++, Zoom, VLC were updated successfully
- Initially, since I was using Chrome at that particular moment, The log indicated *"Not able to update application Google Chrome due to its running process"*, hence the error *"System.OperationCanceledException"* was generated.
- One more log */silentall -nofreqcheck* was used to perform silent update.
- We had 2 types of exit codes: 0 = success, and 3010 = requires restart

5) Automating Updates

- This way I simplified patching by automating updates.

Conclusion:

The app Patch My PC is an important tool for maintaining up-to-date software, reducing the risk of exploitation due to outdated applications.

This project demonstrated my ability to use and analyze patch management tools effectively.
